A systematic review of quantitative EEG findings in Fibromyalgia and ME/CFS

Authors: Systematic review (York/Leeds)

Journal: Clinical Neurophysiology (2024)

DOI: 10.1016

ABSTRACT

Comparative resting-state qEEG in FMS (n=43-85) and ME/CFS (n=28-61) vs healthy controls (n=28-85). Measures: spectral power, individual alpha frequency, eLORETA source, coherence, phase lag index, microstates. Protocol: 1-5 min eyes-open/closed, 19-64 EEG channels. Findings: distinct qEEG phenotypes despite symptom overlap; abnormal central cortical activity involvement.

What was actually measured (numbers):

Multiple case-control studies aggregated, 200s eyes-closed to 20min protocols

Devices / Protocol:

19-64 channel EEG, eLORETA, BEAM, LORETA

Replication across teams / Independence:

Systematic across 5+ labs, sex-matched controls
